

The Wall Record

One sheet. Measure the crack today, measure it again in 90 days. Whether it moved is the thing no single look at a wall can tell you.

Measure at the widest point. Use a ruler with millimetre or 1/16-inch markings. Write the number and the date.

Photograph it straight on, with a coin for scale. Not at an angle. Note where on the house it is, then tick the photo box.

Come back in 90 days and measure the same spot again. That second number is the whole point of this sheet.

LOCATION ON HOUSE e.g. NW corner, under kitchen window	WIDTH #1 widest point	DATE #1	WIDTH #2 90 days later	DATE #2	MOVED? Y / N	PHOTO taken

0.76 mm

A standard credit card edge. If it slides in, you are above roughly 0.8 mm.

1.35 mm

A US dime edge. If it fits, you are above roughly 1.3 mm.

WATCH IT

Fine web-like cracking, or a single corner crack with no staining. Measure again in 90 days.

GET IT LOOKED AT

Wider than a dime edge, stepped, long, or a lip you can feel. Past what a homeowner can assess alone.

ACT ON THIS ONE

Any crack with staining, bubbling paint, a hollow-sounding patch, or white chalky deposits. Width matters least here.
